

When you apply a statistical function to a range of cells in a spreadsheet, it's advisable to separate the cells with a colon instead of a comma. If you use a comma, the function will only be applied to two cells instead of the entire range.

For example, using the **SUM** function with cell locations separated by a comma, such as **B5**, **D5**, will only add the values in those two cells. But using a colon, like B5**:**D5, the **SUM Function** will add the values from cell **B5** to **D5**, which is **B5 + C5 + D5**.
