AVERAGE FUNCTION

The AVERAGE function in Excel is one of the most commonly used statistical functions that allow users to quickly determine the average of a range of cells in a worksheet.

The syntax for using the AVERAGE function is as follows:

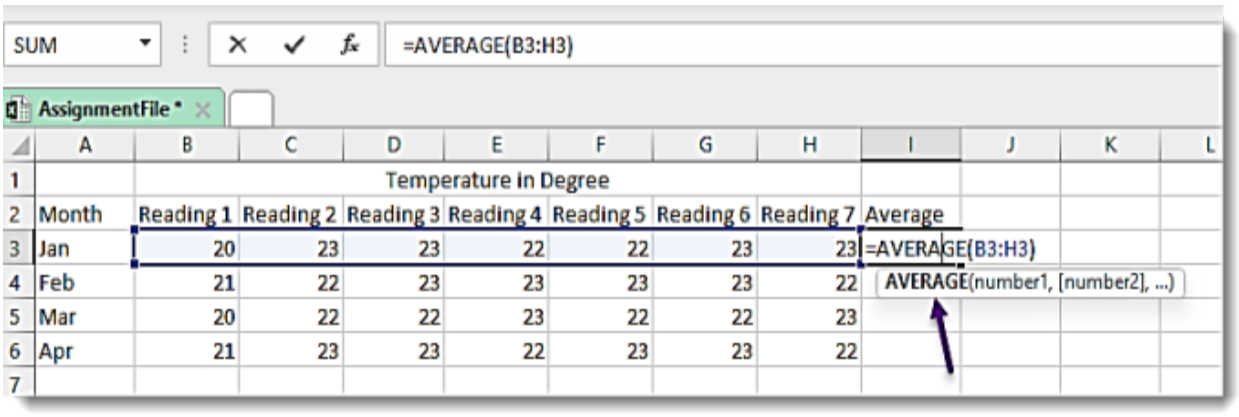

AVERAGE(number1, [number2], ...)

"**number1**" represents the first cell or range of cells for which an average should be calculated.

Adding more cell ranges or individual cells may also be included as optional arguments, separated by commas.

In the example below, you have a range of cells **B3**:**H3** with numeric values; the **AVERAGE** function calculates the average of these values by entering the formula below into the cell **I3**

=AVERAGE(**B3**:**H3**)

The function then returns the average values in cells **B3** to **H3**.
