MAX OR MIN FUNCTION

The MAX or MIN functions in Excel allow you to find the largest or smallest values in a range of cells or a list of arguments.

MAX has the following syntax: **MIN** has the following syntax:

MAX(number1, [number2],....) **MIN(number1, [number2],....)**

For a range of cells **A1** to **A3**, to find the **Highest** value, you used the formula;

=MAX(A1, A2, A3)

A1 represents **number 1**, **A2** represents **number 2,** and **A3** represents **number 3.**

However, a preferable way to use the formula is to use the colon sign. So we have the formula written as

=MAX(A1:A3)

For a range of cells **A1** to **A3**, to find the **Lowest** value, you used the formula;

=MIN(A1: A3)

To use these functions, you must first select the cell where you want the result to be displayed and then enter the function along with the range or list of arguments.

The MAX function finds the highest value in a range of cells.
