MEDIAN FUNCTION

The MEDIAN Function is used to find the central value in a range of cells or a list of arguments in Excel.

MEDIAN has the following syntax:

MEDIAN(number1, [number2],....)

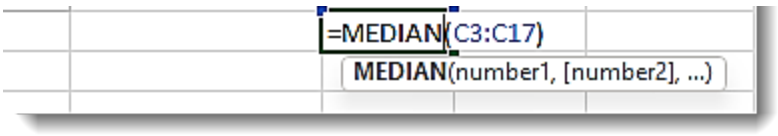

For a range of cells **A1** to **A3**, to find the **central** value, you used the formula;

=MEDIAN(A1: A3)

It helps find trends or patterns in a dataset and is less impacted by outliers or extreme values compared to the Average value. To use MEDIAN, you must first select the cell where you want the result to be displayed.

For example, to determine the median in the range of cells **C3** to **C17**, the following formula is entered into cell **C18;**

=**MEDIAN**(**C3:C17**)

The final results show a Midian cost of **75.**
