MODE FUNCTION

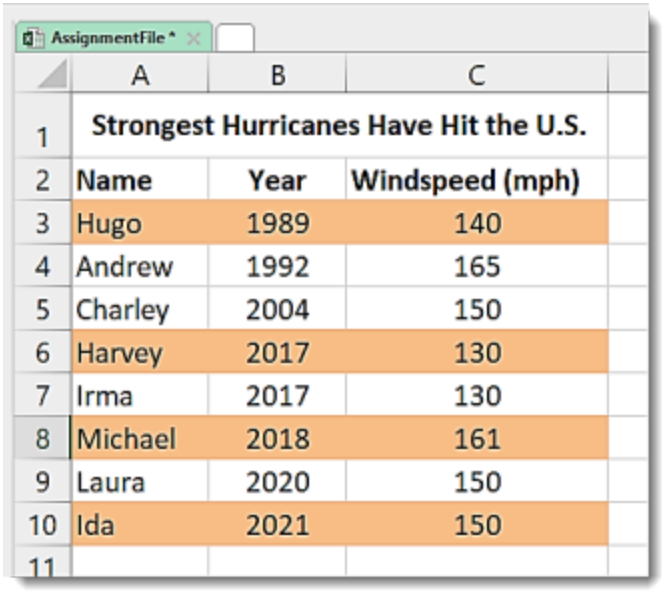

Excel's MODE function is a statistical function used to identify the value that occurs most frequently in a given cell range.

The **MODE** function syntax:

=MODE(number1, [number2], ...)

The MODE function can manipulate cells containing numbers by specifying up to **255 arguments**. These arguments can include numbers or cell references to cells containing numbers.

An example of how to use the MODE function is shown in the example below:

	A	B	C
1	Strongest Hurricanes Have Hit the U.S.		
2	Name	Year	Windspeed (mph)
3	Hugo	1989	140
4	Andrew	1992	165
5	Charley	2004	150
6	Harvey	2017	130
7	Irma	2017	130
8	Michael	2018	161
9	Laura	2020	150
10	Ida	2021	150
11			

If you have a set of **Values** in a range of cells **C3** to **C10** (**Windspeed**), you can use the MODE Function to find the frequency of a particular value using the formula;
