STANDARD DEVIATION FUNCTION

The variability of a data set can be measured by calculating its standard deviation. A low standard deviation means that the data points are gathered around the **mean**, whereas a high standard deviation shows that the data points are more extensively dispersed.

For example, to calculate the standard deviation of a set of values in cells **C3** through **C10**, you would use the following formula:

=STDEV(C3:C10)

	A	B	C	D	E	F	G
1	Strongest Hurricanes Have Hit the U.S.						
2	Name	Year	Windspeed (mph)				
3	Hugo	1989	140				
4	Andrew	1992	165				
5	Charley	2004	150		MODE	150	
6	Harvey	2017	130		STDEV	=STDEV(C3:C10)	
7	Irma	2017	130				
8	Michael	2018	161				
9	Laura	2020	150				
10	Ida	2021	150				

STDEV	12.95

STDEV Result

You can also use the STDEV function to calculate the standard deviation across a range of cells that you have selected that satisfy a particular set of criteria.

For example, if you want to calculate the standard deviation of the values in cells C3 through C10 that are greater than 150, you can use the formula provided below:

=STDEV(C3:C10, C3:C10>150)
