VARIANCE FUNCTION

Excel's built-in VARIANCE function can be used to determine the variance of a data set. Thus, variance quantifies the extent to which a given value or set of values deviates from the mean.

The VARIANCE function requires selecting a range of cells containing the values for calculating the variance.

The **VARIANCE** function syntax is as follows:

=VAR(range)

For example, if you have a set of values in cells **C3** to **C10**, you would enter the following formula in a cell (**F4**) you the result of the variance to appear:

=VAR(C3:C10)
