CORRELATION FUNCTION

The correlation coefficient shows how strong and indicates the direction in which two variables are related. It is a tool in Excel used to determine the connection between two variables, such as the relationship between your weight and height. It is often used to determine how one variable will act based on another.

The **CORRELATION** function syntax:

= **CORREL** (number1, [number2], ...)

You need to provide two parameters to use the CORRELATION function. The first set of data is **number1**, and the second is **number2**. You can specify data in a range of cells, like **C1:C10** and **D1:D10**, or as a list of values, like (2,4,6,8,10) and {2,3,4,5,6}.

	A	B
1	Set 1	Set 2
2	2	2
3	4	3
4	6	4
5	8	5
6	10	6

For example, in an excel worksheet, columns A and B have the following values:
