IF FUNCTION

Excel's IF function is one of its most commonly used logical functions. This function allows you to test a logical condition. This test returns one value if the test is true, and another value if it is false.

The **IF** function syntax:

IF(logical_test, value_if_true, value_if_false)

Logical-test is the first argument **required** to state the condition to be evaluated and will either return a result of TRUE or FALSE.

Value_if_true is an optional argument used to indicate the value to be returned if the evaluation of the logical_test is TRUE.

Value_if_false is an optional argument used to indicate the value to be returned if the evaluation of the logical_test is FALSE.

Any of the following logical operators can be added to your arguments when using the IF function in Excel:

- = (equal to)
- < (less than)
- > (greater than)
- >= (greater than or equal to)

  - ♦ <= (less than or equal to)
  - ♦ <>(not equal to)

For example, the **IF** function can test if the content of a cell is a value greater than and equal to **15**, and then return "**High**" if the test is **True**, and
