Formulas containing text **references** require **quotation** marks, even if only a space is used. You will see the **#NAME**? error if you do not use double quotation marks "" for a text value.

For example, If the condition to return the Text value **BOY** requires a cell to contain the value **1**, or **GIRL** if the cell has the value **2**. If not placed inside double quotation marks, Excel won't recognize the text value.

The **#NAME?** error appears when Excel cannot recognize the text you entered in a formula or function, when you enter a range name incorrectly, reference a deleted range name, or fail to quote your text.

BOY should be "BOY**"**

GIRL should be **"**GIRL**"**
