OR FUNCTION

The OR function in Excel is a logical function that allows you to evaluate one or more conditions and determine if any of them are TRUE. It returns a TRUE value if any of the conditions given are true and a FALSE value if all conditions are false

The OR function allows you to create multiple conditions and evaluate them one after the other. If any of the conditions are true, the OR function will return a TRUE value.

The OR function syntax is as follows:

OR(condition1, condition2, ...)

For example, in the formula

=OR(B3>30 years old, C3= “US”)

The **OR** function in the above formula checks if the content in cell **B3** has the value **30** or if the content in cell **C3** has the text entered as **US**. The result of the function will be TRUE if either one of the conditions is met; otherwise, it will return FALSE.

You can also create more complex formulas by adding the **OR** function in conjunction with other functions, such as the **IF** function.

For example, a **VISA LIST** has a condition that applicants must be **US** citizen **OR** is above **30** to be **Admitted** into the country if TRUE, else **Denied** if FALSE.

The formula used is;

=IF(OR(B4>30,C4="US"),"Admitted","Denied")
