

In the above example, the **OR** function checked if the value in cell **B3** is greater than 30 or the Text in cell **C3** is **US**.

If either condition is true, the formula will return **Admitted**, otherwise it will return **Denied** if false.

Advanced formulas also involve combining the **OR** function with other Excel functions, such as **IF**, **AND**, and using parentheses to separate the different sections of the functions. This type of formula is called **Nested** function in Excel.
