TRUE FUNCTION

The TRUE function in Excel returns TRUE and is often combined with other logical functions to make more complex and accurate decisions. The TRUE function is commonly used with the IF function to hardcode TRUE value in decision-making.

For example, if you want to check if a certain cell value is greater than 10 and return the value of "**Admit**" if true, you can use the TRUE function in combination with the IF function like this:

=IF(C3>10,TRUE,"Deny")

This formula returns **TRUE** if the value in cell **C3** is greater than 10 and "Deny" if the value is not greater than 10.

Notice the word **TRUE** was not placed inside an open and closed quotation mark, yet Excel recognized it as a Function, and no error was detected.

The TRUE function can also be used with the **AND** function to return True only if all conditions are met.
