FALSE FUNCTION

The FALSE function in Excel is a logical function that returns a logical value of FALSE. It is frequently employed with other logical functions such as AND, IF, and OR to create more complex formulas and make more accurate decisions based on the data.

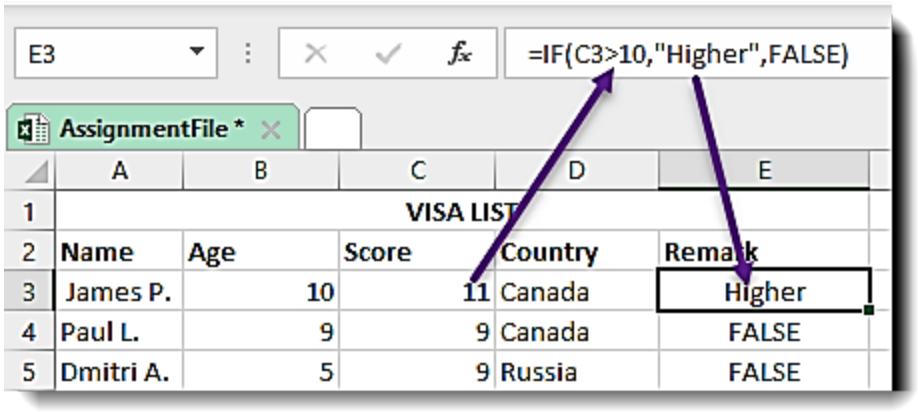

The FALSE function is often used with the **IF** function, which helps make decisions based on conditions. When you need to put the value of **FALSE** in your formula, the FALSE function can be helpful.

The FALSE function syntax is as follows;

FALSE()

For example, to check if a cell value is greater than **10** and return the value "**Higher**" if true, and "Not Higher" if false, you can use the FALSE function in combination with the IF function like this:

=IF(C3>10,"Higher",FALSE)

This formula will return "**Higher**" if the value in cell **C3** is greater than **10**, and FALSE if the value in the same cell **C3** is not greater than 10.
