IFERROR FUNCTION

IFERROR function in Excel is a handy feature that helps you control and manage errors in your formulas. It examines if a formula or calculation generates an error; if found, it returns a defined value or text instead of the error message.

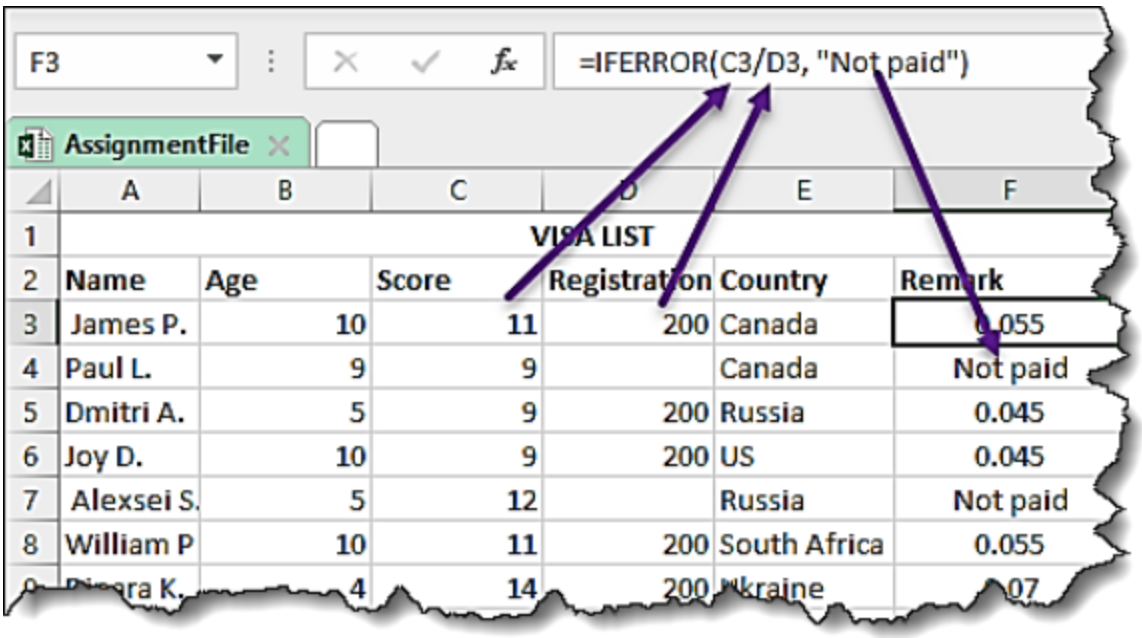

The IFERROR function syntax is:

IFERROR(value, value_if_error)

The IFERROR function requires two inputs: the **value** or formula being checked for errors and the **value_if_error** or text that should be returned if an error is identified.

For example, the formula

=IFERROR(**C3/D3**, "Not Paid")

	A	B	C	D	E	F
1	VISA LIST					
2	Name	Age	Score	Registration	Country	Remark
3	James P.	10	11	200	Canada	0.055
4	Paul L.	9	9		Canada	Not paid
5	Dmitri A.	5	9	200	Russia	0.045
6	Joy D.	10	9	200	US	0.045
7	Alexsei S.	5	12		Russia	Not paid
8	William P	10	11	200	South Africa	0.055
9	Pierra K.	4	14	200	Ukraine	0.07
