UPPER FUNCTION

The UPPER function in Excel proves to be a valuable asset when converting text to all uppercase letters. This function is convenient when dealing with a vast amount of data as it enables swift and uncomplicated text standardization.

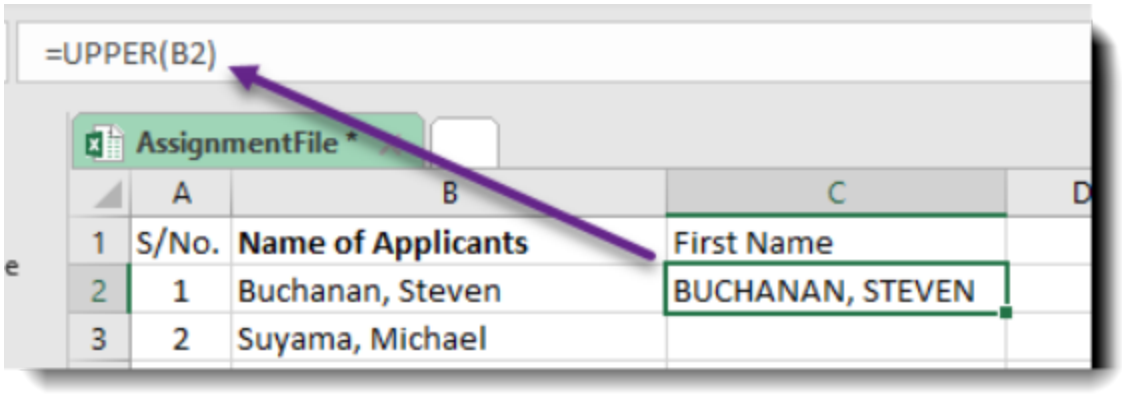

The UPPER function syntax is as follows:

=UPPER(text)

The UPPER function is a straightforward tool in Excel that requires a single input: the text you wish to change to all uppercase letters.

For example, if you wanted to convert the text in cell **B2** to uppercase letters, you would use the formula:

=UPPER(B2)

The result is "**BUCHANAN, STEVEN**" all in Uppercase.

When you are dealing with a substantial amount of data, being consistent in the format of the input is essential. For instance, when compiling customer names, it is crucial to keep the case of the names uniform.
