LOWER FUNCTION

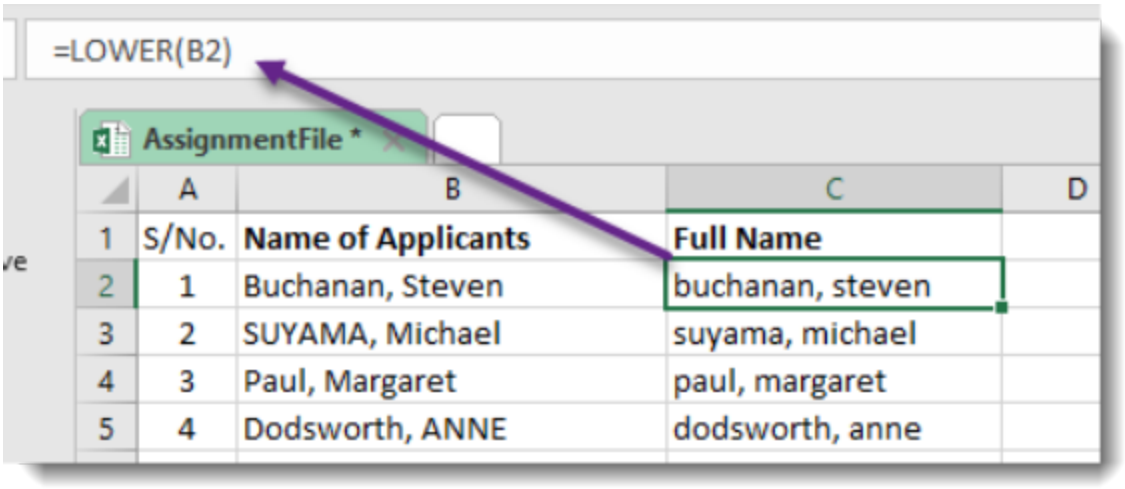

The LOWER function in Excel, enables you to change the text in a cell to lowercase. It's useful when dealing with mixed-case text data as it allows for standardizing the case of text for sorting, filtering, and other forms of data manipulation.

The UPPER function syntax is as follows:

=UPPER(text)

Where "text" is the specified cell or range of cells with the text you want to convert to lowercase.

For example, if cell **B2** contains the text " Buchanan, Steven" using the LOWER function would convert the text in cell B2 to " buchanan, steven"

	A	B	C	D
1	S/No.	**Name of Applicants**	**Full Name**	
2	1	Buchanan, Steven	buchanan, steven	
3	2	SUYAMA, Michael	suyama, michael	
4	3	Paul, Margaret	paul, margaret	
5	4	Dodsworth, ANNE	dodsworth, anne	

The **LOWER** function also enables the conversion of text in a range of cells by selecting the range of cells to be converted and entering "=LOWER(B2:B4)" into a designated cell, with B2:B4 representing the specific range of cells to be transformed to lowercase.
