MID FUNCTION

The MID function is an Excel function that extracts a particular portion of a text string from a larger text string. It requires three arguments: the text string, the starting position of the desired text, and the number of characters to be extracted from the text string.

The MID Function Syntax is:

MID(text,start_position,number_of_characters)

For example, if you have a column to fill in the name of job applicants, you can use the MID function to extract their **First names**.

	A	B	C
1	**Name of Applicants**	First Name	
2	Buchanan, Steven		
3	Suyama, Michael		
4	Paul, Margaret		
5	Dodsworth, Anne		
6	Leverling, Janet		
7	Davolio, Nancy		
8	Wartian Herkku		

Suppose you want to extract the content of cell **A2** with the text "***Buchanan, Steven***" to extract the word "***Steven***".

The MID function formula will be

=MID(A2, 11, 6)

Where **A2** is the cell containing the text. The function would return "***Steven***" because it starts at the 11th character (including the space between)
