LOOKUP(lookup_value,table_array,col_indexnum,[result_vector]).

- The **Lookup_value** is the student's name or cell containing the data.
- The **table_array** is the range of cells **A4:A11** that comprises all the student names. However, before referring to it, **you must sort** the list (the column) in ascending order.
- The **result_vector,** is the range of cells **C4:C11** from which an expected value is to be returned. Several lookup functions in Excel can be used to retrieve data from a table or range of cells. Here are a few examples:

The dashboard area has a provision created to enter the student's name in cell **F10,** as illustrated below.

	A	B	C	D	E	F
1	Score Sheet					
2						
3	Student Name	Faculty	Score			
4	Adam	Medicine	64			
5	Degroot	Enginn	24			
8	Mckenzy Olds	Law	30			
9	Sarah	Law	43			
10	Sue	Economics	34		Student Name	
11	Vin	Public Health	53		Score	
12						

The Lookup function is placed in cell **F11**, which will search for the data in cell **F10** within the Score Sheet to automatically return the student's score.

The format of the Lookup formula entered in cell **F11**, referring to the vector form discussed earlier, is as follows:

=LOOKUP(F10,A4:A11,C4:C11)
