VERTICAL LOOKUP (VLOOKUP) FUNCTION

Vlookup also called Vertical lookup is a type of search that allows a user to input a specific value and returns the corresponding value from the same row in another column.

Excel offers a variety of methods for performing Vlookups, including:

VLOOKUP function

The VLOOKUP function in Excel is a powerful search and retrieval tool that allows you to locate data quickly.

Using the VLookup Function, you can quickly and easily retrieve a customer's information from a database without searching multiple data sheets.

If the data you want to retrieve is located in the leftmost column of your table and you don't plan on making any changes to the table's structure, it's safe to use a standard Vlookup formula.

A **VLOOKUP** function consists of the following components:

- The value you would like to look up
- The specific range within which the desired value is to be searched and the value that is returned.
- The column number within the defined range holding the returned value.
- Indicate whether you want an exact or approximate match of the desired value by using 0 or FALSE for an exact match and 1 or TRUE for an approximate match.
