HORIZONTAL LOOKUP (HLOOKUP) FUNCTION

Excel's Horizontal Lookup, also called **HLookup**, comes with features that allow you to search for a specific value in a row within a dataset and retrieve the corresponding value from the same column. This function is handy when working with large amounts of data, as it allows for efficient and precise retrieval.

The HLookup syntax is as follows:

=HLOOKUP(lookup_value,table_array,row_index_number, [range_lookup])

The HLookup function in Excel searches for a specific value, 'lookup_value', within the range of cells 'table_array' you selected. Also, the 'row_index_number' in the formula indicates the row of the column where the matching value is located. And the 'range_lookup' is a true or false input you are to use to determine if the search should be an exact match or an approximate match.

For example, using the formula;

=HLOOKUP(“iPhone”, B2:C6, 2, TRUE)

The above formula is used to look for the value “iPhone” within a range of cells **B2:C6**, and to return the corresponding value from the same column in Row 2.

However, because the **range_lookup** value is already set to **TRUE**, the HLookup function will search for the closest match to “iPhone” if it cannot find an exact match.
