

On the list, **Ben** is on the **Fourth row,** counting from the **First row** with reference to the cell range **A3:C11** (table_array)**.**

HLOOKUP in Excel operates similarly to VLOOKUP. However, instead of scanning a vertical list and finding a value from a matching column, it searches a horizontal list (row 4) and retrieves a value from a corresponding row.

The first input is the value to search for (**Score**), the second is the area to search (cell range **A3:C11)**, the third indicates how many rows below the lookup value to search (value in cell **F10)**, and the fourth determines if an approximate match should be used.
