How to utilize the MATCH function

The **MATCH** function in Excel is an excellent tool you can use to determine the position of a particular value in a range of cells.

The syntax for the **MATCH** function in Excel is as follows:

MATCH(lookup_value,lookup_array,[match_type])

To use the MATCH function, you will need to input the **lookup_value**, the range of cells to be searched by the Lookup_value, and the match type which is optional.

The value you want to find is referred to as the **lookup_value**. The lookup_array defines the range of cells that will be searched.

The **match type** is an option that informs Excel to decide whether it should settle for a close approximation if the desired lookup value is not found in the specified lookup range. It can be specified as **1** for an exact match, **0** for a similar match, or **-1** for an exact match in descending order (the default is set to **1**).

For example, if you wanted to identify the location of the word "**EliteBook**" in the cell range **A2** to **D8** below:
