INDEX-MATCH-MATCH FUNCTION

The INDEX-MATCH-MATCH function combines three Excel functions: INDEX, MATCH, and MATCH. INDEX function retrieves a value from a given range or array, MATCH function finds the position of a value within that range or array, and the third MATCH function enables the INDEX and MATCH functions to work together in a lookup formula to extract multiple values from an array.

The INCEX-MATCH-MATCH syntax is as follows:

INDEX (array**,MATCH(**lookup_value,lookup_array,0**) , MATCH (**lookup_value, lookup_array,0**))**

The INDEX-MATCH-MATCH function involves three steps:

- First, specifying the lookup_value, which can be a single value or a range, to be searched in the lookup array;
- Second, defining the lookup array as the range or array where the lookup_value will be searched; and
- Third, defining the match type, a setting that determines if Excel should return a close match if the lookup_value is not found in the lookup array.

Once the above steps stated are complete , the INDEX-MATCH-MATCH function will give you the location of the "lookup_value" within the "lookup_array."

For example, if the product called " **IdeaPad**" is the "lookup_value" and the "lookup_array" is from cell **B2** to **B9** as illustrated below.
