

The INDEX formula in Excel requires calculating results from two MATCH formulas. As you can see from the table, the "**IdeaPad**" is the 5th item in the left column and "2023" is the 6th value along the headers in the top row, these formulas become 5 and 6, respectively. After simplifying these components, Excel performs an INDEX lookup that goes 5 rows down and 6 columns to the right to retrieve the value "**$106,424.25**".
