NOW FUNCTION

The NOW function dynamically displays the current system date and time. This Function allows you to return the current date and time without manually entering it. It also updates itself automatically whenever you carry out any modifications on the worksheet. For example, any changes you make to values will cause the NOW Function to refresh. If you need to update the worksheet manually, press F9 to recalculate the value.

The NOW Function syntax is:

=NOW()

The NOW function doesn't require an argument because the parenthesis is empty.

Suppose you have a **Sales Recept** and want to show the time when the payment was made or printed. As illustrated below, a section of the receipt cell **F12** returns the current time.
