WEEKDAY FUNCTION

The WEEKDAY function allows you to determine the day of the week using a given date, provided as an argument.

The WEEKDAY Function syntax is:

=WEEKDAY(serial_number, [return_type])

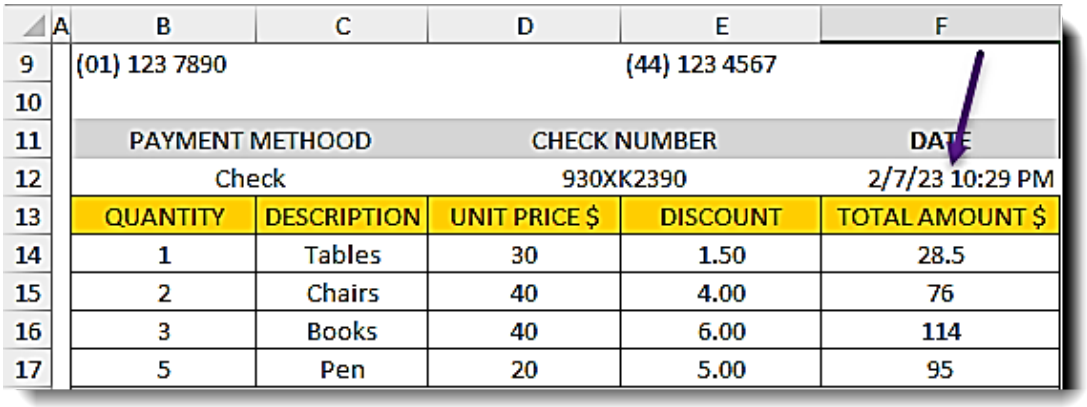

The **serial_number** is a digit indicating the day from which you desire to determine the weekday.

The **return_type** is optional, but it is a value used to determine the type of value to be returned.

By default, you use the **return_type** to indicate the first day of the week. If you ignore adding it to the formula, Excel will use the first day as Sunday to be 1 and Saturday as 7.

The value returned is always an integer, which ranges from 0 to 7, with 1 representing the starting day specified by you.

For example, to determine the weekday in cell **F12** as illustrated below:

	A	B	C	D	E	F
9		(01) 123 7890			(44) 123 4567	
10						
11		PAYMENT METHOOD		CHECK NUMBER		DATE
12		Check		930XK2390		2/7/23 10:29 PM
13		QUANTITY	DESCRIPTION	UNIT PRICE $	DISCOUNT	TOTAL AMOUNT $
14		1	Tables	30	1.50	28.5
15		2	Chairs	40	4.00	76
16		3	Books	40	6.00	114
17		5	Pen	20	5.00	95

The formula entered in cell **G12** is:

=WEEKEND(F12)
