HOW TO CHANGE THE CHART TYPE

You will need to start with the basics first. Check to see what chart you use: a line, bar, or pie chart. Every type of charts created in Excel has its own pros and cons, so picking the right one for the data you want to show is important.

For example, a line chart is an excellent option to show how a particular variable changes over time. On the other hand, if you intend to compare the sizes of different categories, a bar chart might be more suitable.

So, if you have created a Line chart but want to change it to a Bar chart, don't worry; it's a simple process. In Excel, you only need to select the chart, click on the **Chart Design** tab, and then click on **Change Chart Type** icon.

From the **Change Chart Type** dialog box, you can comfortably choose the new chart type you want to use.
