PRINT QUALITY

Excel provides a range of print quality options depending on your printer make. These options range from ***Draft copy*** to ***High quality*** or different **Dot-Per-Inch** (DPI), and they determine the resolution of your printed worksheet.

A high dots-per-inch (dpi) resolution is the best option if you want high-quality printing results. However, remember that this can sometimes result in more extended printing time. So, while you will be getting sharper and more detailed prints, you may need to exercise patience while you wait for your documents to finish printing. I suggest you weigh the pros and cons and decide what works best for your needs.
