PRINT

This section determines the content printed from the worksheet, the printout's color scheme, and the level of print quality.

- **Gridlines**- By default, when you print a worksheet in Excel, the gridlines on the screen do not appear in your printout. However, you must check the Gridlines box if you want to include the gridlines in your printed document.
- **Black and White** - If you have a color printer but only want to print in black and white, you can select the "**Black and white**" checkbox. This option is not selected automatically, so you must check the box yourself. But if you have a printer that only prints in black and white, you don't need to worry about this option.

  Draft quality - If you want to print something quickly and don't mind if the quality is not the best, you can select the "**Draft quality**" option. This feature is only available on printers that support the draft-quality mode. Remember that choosing the " **Draft quality**" option won't make any difference if your printer doesn't have this mode.
