PROTECTING THE ENTIRE WORKBOOK

If you want to protect your workbook, there are three options you can consider. Firstly, you can **encrypt** it with a password. This means that only one with the password can open the workbook.

Secondly, you can make the file open as **read-only** by default. This means that people can view the workbook but cannot edit it unless they choose to do so.

Finally, you can **protect the structure** of the workbook. This means that anyone can open the workbook, but they need a password to do anything related to the structure, such as deleting worksheets, rearranging them, renaming them, or creating new worksheets.

By using these options, you can restrict access to your workbook and protect its contents from unwanted changes. It's important to carefully consider which option is right for you based on your needs and requirements.
