# PROTECTING SPECIFIC CELLS WITHIN A WORKSHEET

Protecting a specific cell within a worksheet means restricting access to that cell so that someone else cannot edit, delete, or modify it. This can be useful when you want to keep certain information secure or prevent accidental changes.

However, the process used in locking cells in excel is quite tricky. Because, by default, all cells in Excel are locked. To Confirm this, right click on any cell and click on the **Format Cells.**

Under the Protection tab in the Format Cells dialog box, shows that the cell is already locked.
