INTRODUCTION TO MACROS IN EXCEL

A **Macro** in Excel is a little helper you can create and customize for many tasks. Once you have created it, you can give it a name, save it, and use it repeatedly. It works by recording all the clicks and keystrokes you make while performing a specific task and replaying them whenever you run the macro. This can save you a lot of time if you have to do the same thing repeatedly, like manipulating data or generating reports.

You have a couple of options for recording and running macros in Excel. You can use the built-in Excel commands or Excel VBA, short for Visual Basic for Applications. VBA is a programming language that's pretty easy to use, and you can access it through the Excel Visual Basic Editor, which you can find on the DEVELOPER tab in the Excel Ribbon.

When you start to record a macro using Excel, it will generate a VBA code for you. If you are happy with how your macro works and don't need to make any changes, you don't need to know anything about VBA. Nevertheless, if you need to make any changes to your macro, you must work with the Excel Visual Basic Editor codes.

If you're new to macros, don't worry – I will walk you through recording a simple macro using Excel commands in this **Lesson 16.**
