by default.

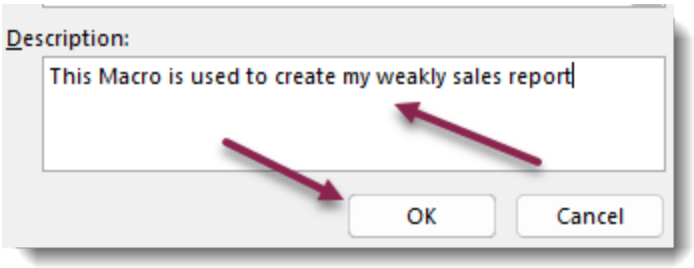

- **New Workbook**

Excel will save your macro in a new workbook, but it's unnecessary and, honestly, not the best option.

- **Personal Macro Workbook**

It allows you to combine all your frequently used macros into a single location, making it convenient to access them from multiple workbooks.

1. Enter a description of the macro and then click on the "**OK**" button to start recording the macro.

1. Start creating the table you want the Excel macro to automate. This includes formatting the cells and inserting your formulas where necessary. You can also refer to data in another worksheet or make copies.
