ADJUSTING COLUMN OR ROWS MANUALLY

To manually adjust the size of columns or rows in Excel, you need to position your cursor on the boundary line of the column or row headers, then drag the mouse to the desired width or height of your cell content.

This method might work fine for some cells, but when you enter data into another cell within a row or column, you might start having issues because they do not look uniform.

That now leaves us with the third option called **AutoFit**, which is much more convenient in many scenarios where you have to adjust column width or row height.
