CUT, COPY, AND PASTE DATA

Apart from various other tasks that can be performed in a workbook, you have the option to utilize the **Copy**, **Cut**, and **Paste** commands to transfer and duplicate your data from one location to another within the same worksheet, between worksheets, or even between different workbooks.

It is a must to select the cell or range of cells before you can use the **Cut**, **Copy** and **Paste** commands.

When done selecting the data, choose the **Cut** or **Copy** command on the **Home** tab of the Excel ribbon.

Alternatively, on your keyboard, press **Ctrl**+**X** to **cut** or **Ctrl**+**C** to **copy** the data selected. The difference between copy and cut is that the original data remains in its location when you **copy**, while the **cut** command removes the data from its original location after you must have **Paste** the data.
