AUTOCOMPLETE DATA ENTRY

When using AutoComplete, you only need to type the first few letters of a text entry into a cell before Excel fills in the rest of the text based on previous entries.

For example, if you have a list of items to be sent to different locations, a particular item might be going to several locations.

So with Autocomplete, data for the item will be filled once you enter the first few letters and press the **Enter** key.

The letter '**P**' only was typed.

Once you type the letter **'P'**, the remaining text (**hones**) is filled with Autocomplete and entered when you press the **Enter** key.

Excel looks at the previous entries in column **B** and tries to inform you **if** you are trying to enter **Phones** because it already sees **Phones** in this column.

AutoComplete is a great tool when entering information where you have duplicate entries, often repeating in the same column.
