EXCEL TABLES

In Excel, a table refers to a structured collection of data organized in rows and columns, with each column identified by a unique header or label.

Tables offer an efficient method for managing and analysing extensive datasets due to their integration with various useful functions like sorting, filtering, and formatting.

Upon creating a table in Excel, the software automatically applies formatting to the data range, potentially including bold headings or dropdown column menus. Furthermore, each table is assigned a distinct name, simplifying its reference in formulas or other parts of the workbook.

Excel tables are dynamic, meaning that when items are added or rows/columns are removed, the table range adjusts automatically, updating all formulas or references accordingly.

The image below illustrates the distinction between a range and a table:

INTERVAL				TABLE		
PRODUCT	JAN	FEB		PRODUCT	JAN	FEB
Apples	321.00 €	205.00 €		Apples	321.00 €	205.00 €
Peaches	3.34300 €	889.00 €		Peaches	3.34300 €	889.00 €
Lemons	2.42100 €	3.43200 €		Lemons	2.42100 €	3.43200 €

From a broader perspective, Excel tables are an excellent tool for managing and analysing extensive datasets. They streamline numerous tasks involved in data processing, thereby enhancing efficiency and productivity.

CREATE A TABLE

To create a table in Excel, follow these steps:

1. Select the range of cells that you want to include in the table, including column headers (if any).
2. Go to the *Insert* tab on the ribbon bar.
3. Select the *Table* icon in the *Tables group*. Alternatively, you can use the keyboard shortcut *Ctrl + T.*
