- **Total Rows**
  Excel tables come with an integrated *Total Rows* function, enabling quick calculation of totals for each column of data.

- **Calculated columns**
  This represents another useful feature that automatically adds columns based on the formulas or functions entered. For instance, when employing the *AVERAGE* function in a new column, Excel automatically copies the formula to other cells in the same column upon pressing Enter, formatting each row accordingly

PRODUCT	JAN	FEB	AVERAGE
Apples	0.32100 €	0.20500 €	0.263
Peaches	3.34300 €	0.88900 €	2.116
Lemons	0.0242 €	3.43200 €	1.728105
Total	3.68821 €	4.52600 €	

- **Named Range**
  As mentioned earlier, Excel tables are automatically assigned a name, which can be used in formulas and throughout the workbook to reference the table itself.
- **Data validation**
  All Excel tables allow you to apply data validation rules, ensuring that the data entered in the table meets specific criteria for accuracy and consistency.
- **Structured references**
  Structured references can be used in formulas, simplifying the
