SORT DATA

Sorting data involves organizing values in a specific order based on one or more criteria. Excel provides various options for sorting data, including ascending order (smallest to largest or A to Z) and descending order (largest to smallest or Z to A).

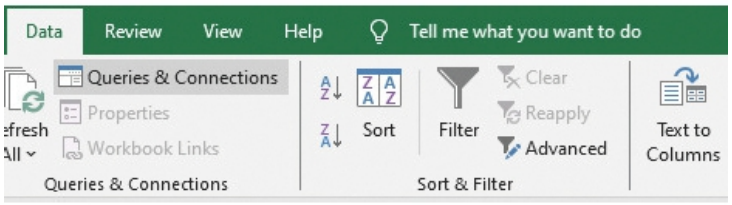

This function can be useful for quickly finding and analysing data. For instance, you can sort a list of customer names alphabetically or sort sales data to identify the best-performing products.

Excel allows the sorting of single or multiple columns of data, enabling sorting by values, text, dates, or other criteria. Additionally, you can customize the sort order and specify secondary or tertiary sort criteria when needed. Sorting is a fundamental function in Excel, essential for efficiently manipulating and analysing large datasets.

SORT DATA IN EXCEL

To effectively sort data in Excel, follow these steps:

1. Select the range of cells you want to sort. Can be a single column or a group of columns.
2. Select the *Data* tab in the ribbon bar.
3. Click on the Sort button in the *Sort & Filter* group.

4. At this point, the Sort dialogue box will be displayed. Here you can choose the column you want to sort and the order (ascending or descending) to apply. Additionally, you can choose to sort multiple columns.
