DATA FILTER

Data filtering in Excel refers to the process of displaying a subset of data based on specific criteria, hiding information that does not meet the set criteria. This enables users to focus on relevant data and analyse it more effectively.

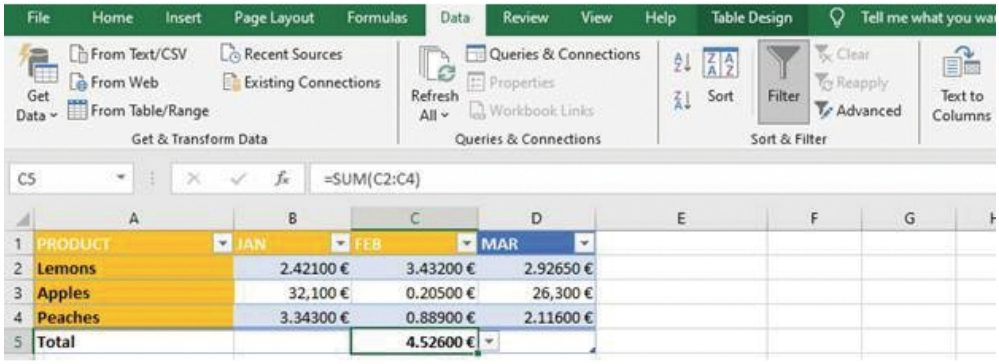

Excel provides various filtering options, allowing users to filter data based on text, numbers, dates, and other criteria. Multiple filters can be applied to different columns simultaneously, enabling more refined data filtering. Unlike sorting, which rearranges data while keeping all rows visible.

Overall, filtering is a valuable function, particularly when dealing with extensive and diverse datasets.

DATA FILTER

To filter data in Excel, simply follow these steps:

1. Select the range of cells you want to filter. Can be a single column or a group of columns.
2. Select the *Data* tab on the ribbon bar.
3. Select the *Filter* button in the *Sort & Filter* group.
4. Filter *drop-down arrows* will now appear in the header of each column. Click on the *drop-down arrow* of the column you want to filter.

5. Select the criteria by which you want to filter. For instance, you may choose to filter by a specific text string, date range, or numeric value.
6. Once you have chosen the filter type, Excel will hide the rows that do not meet the criteria you set, displaying only the relevant data.
