UNDERSTAND CHARTS

In Excel, a chart or graph is a visual representation of data, presented in various formats such as bar charts, line charts, pie charts, combination charts, and more. These graphical representations simplify complex data sets, making them easier to interpret.

Creating a chart in Excel is straightforward: select the data you wish to visualize and use the chart creation wizard. This tool generates a chart based on the selected data, allowing you to customize its appearance, including chart type, colours, labels, and formatting.

Charts are widely used across industries such as business, finance, and science due to their versatility and effectiveness in analysing data. They help identify trends, patterns, and outliers, empowering decision-making based on insights gleaned from the data.

TYPES OF CHARTS

Different types of charts can be created in Excel. Here are some of the most common types of charts:

1. **Column charts**

   This type of chart is used to compare the values of different categories. The vertical bars stand for the values, while the categories are shown on the horizontal axis.

2. **Bar Charts**

   This chart is similar to the column chart but has the axes reversed: in this chart the bars are horizontal, and the categories are shown on the vertical axis.
