

6. Area Charts

This type of chart is commonly employed to illustrate the variation of a dataset over time. Data points are connected by lines, with the area below the lines often filled in to enhance visibility and comprehension.

7. Radar Charts

This type of chart is useful for comparing values across different categories. In a radar chart, values are depicted by points positioned on rays originating from the centre of the chart.

8. Combo Charts

This category combines two or more chart types into a single chart. For example, a combo chart may include a line chart and a column chart, so that the relationship between two sets of data can be visualized.
