1. comparing charts
2. proportion charts
3. distribution charts
4. trend charts

COMPARING CHARTS

Charts of this type are useful when you want to compare one dataset with another. In these cases, you can choose from several types of charts, although the best choice depends on the number of datasets and whether there is a hierarchical structure present.

For instance, comparating charts are useful when you need to compare profits from different products or the performance of multiple departments.

In such cases, you can use one of te following charts:

- **Column or Bar Chart**
  Two or more datasets can be used to show relational differences between categories.
- **Treemap Chart**
  Useful for highlighting any hierarchical relationships with rectangles.
- **Sunburst Chart**
  Perfect for showing a hierarchical comparison with different rings.
- **Scatter Chart**
  This type of chart is suitable for scenarios involving at least two datasets and where the data represent measurements. It allows for a straightforward comparison of the data.
- **Bubble Chart**
  This group of charts is applicable when you have at least three datasets, with one of them determining the size of the bubble.

PROPORTION CHARTS

These types of charts are useful when the aim is to illustrate the components comprising a whole.

For instance, you can utilize these charts to display the percentage of sales from each vendor, website visits categorized by location or device
