This type of chart can effectively illustrate the variations within multiple datasets and their relationships. Additionally, the chart incorporates quartile, median, minimum, and maximum values.

TREND CHARTS

As the name suggests, these charts enable the analysis of trends in one or more datasets over time. They are ideal for examining changes in sales over the years, customer consumption habits, fluctuations in sales figures, and more.

Charts in this group include:

- **Line Chart**
  This type of chart is most often utilized to compare data points and highlight trends over days, months, years, similar time periods, or by category.
- **Area Chart**
  The area chart can be employed as an alternative to the line chart to emphasize the extent of change over time.
- **Column or Bar Chart**
  These types of charts are useful for showing values and their trend over days, months, or years.

OTHER FEATURES OF EXCEL CHARTS

Then, some other charts serve more specific and narrower purposes than those seen on the previous pages. These charts include:

- **Waterfall Chart**
  This chart can be useful when you want to show what the positive and negative effects are on certain values.
- **Funnel Chart**
  The funnel chart highlights the decreasing stages of a specific process, moving from macro to micro.
- **Surface Chart**
  Such charts are perfect for displaying trends or the best relationships among analysed values.
