variables. Due to their design, they are commonly used to analyse performance-related metrics, like sales data or customer satisfaction levels over time or across different departments or regions. Each data point in a radar chart is typically represented by a different colour or symbol, facilitating easy identification and comparison.

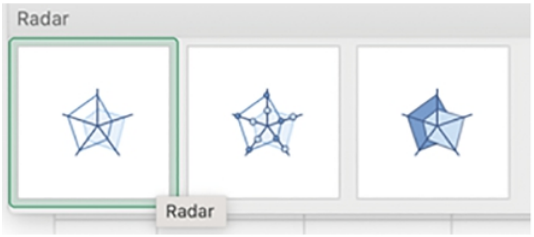

Moreover, radar charts offer numerous customization options, such as the addition of data labels, modification of colors and styles for chart elements, and adjustment of axis scales. Leveraging these features allows users to craft visually engaging radar charts that offer insightful interpretations of the underlying data.

To create a radar chart in Excel, follow these steps:

1. Enter the data you want to display on the radar chart. Make sure the data is in a format that can be easily plotted on a radar chart.
2. Select the data range you are interested in and click the *Insert* tab on the Ribbon bar.

YEAR	I	II	III	IV
2015	236.00000 €	253.00000 €	210.00000 €	320.00000 €
2016	257.00000 €	255.00000 €	357.00000 €	198.00000 €
2017	287.00000 €	179.00000 €	252.00000 €	290.00000 €
2018	290.00000 €	280.00000 €	310.00000 €	350.00000 €
2019	325.00000 €	389.00000 €	410.00000 €	425.00000 €
2020	412.00000 €	434.00000 €	465.00000 €	451.00000 €

3. Click the *Radar Chart* icon, in the *Charts* group.
4. Select the type of radar you want to use. You can choose from several types, including *radar chart, filled radar chart*, and *radar chart with markers.*

5. Once you reach this stage, the radar chart will be generated, and you can proceed to customize it by adding labels, changing colours or adjusting axis scales.
