6. After completing your modifications, if you want to incorporate additional data, right-click on the chart and press *Select Data* and then *Add*.
7. Select *Series Name* and *Series Value* as the values. Finally, click *OK*. Repeat this procedure for all data.
8. To change the colours of the chart, right-click on the chart and select *Format Chart Area*. You can choose between several different styles and colours.
9. To adjust the scales of the axes, right-click on the chart and select *Format Axis*. This will provide you with the option to adjust the *minimum* and *maximum* values for each axis.
10. Once you are done, you can save the chart in the format you prefer.

HEATMAP CHART

The heatmap chart provides a visual depiction of data, utilizing colours to convey the values of various data points. In this chart type, data is presented in a tabular format where rows and columns represent specific categories and subcategories, and cell colours indicate the magnitude of data values.

Heatmaps are useful for identifying patterns and trends within extensive data sets, as well as for highlighting areas of high or low values. They find widespread application across domains like finance, marketing, and sports analysis, where rapid and efficient analysis of large data volumes is essential.

Creating a heatmap chart involves selecting the data to be depicted, choosing the appropriate chart type, and customizing the chart settings to present the data in the desired format. Excel offers numerous options for tailoring the appearance of heatmap charts, including adjustments to the colour scheme, addition of data labels, and refinement of labels and axis titles.

To create a heatmap chart in Excel, follow these steps:
