WORKING WITH PIVOTTABLE

You can work with a PivotTable in different ways. The following are some of the basic features:

1. ***Creating a PivotTable***
   To create a PivotTable, select the data set you want to analyse and click the *PivotTable* option, on the *Insert* tab.
   Choose the location where you want to place the table and drag the relevant fields to the different areas of the PivotTable.

2. ***Organization and filtering***
   The PivotTable can be reorganized by dragging fields between rows, columns, and value areas. Additionally, the PivotTable can be filtered by selecting items in the drop-down menus of the fields or by applying a filter to the PivotTable.

3. ***Editing calculations***
   Calculations performed in the PivotTable can be modified by changing the summary function or adding fields or calculated elements.

4. ***Formatting and design***
   All PivotTables can be customized and formatted according to personal needs. For instance, you can change the font, colour and style of the PivotTable. Alternatively, a predefined PivotTable style can be applied.

5. ***Updating the data***
   As anticipated, you can update the data in the PivotTable with new information or by making changes to the original dataset. To do so, right-click on the PivotTable and select Refresh. Alternatively, you can select the *Refresh All* option on the *Data* tab.
