6. Creation of PivotCharts

You can enhance the visualization and interactivity of your data by creating PivotCharts based on PivotTables. To create a PivotChart, select the PivotTable and click the *PivotChart* option, on the *Insert* tab.

PRACTICAL EXAMPLES

Many new users initially find PivotTables hard to understand but their functionality becomes much clearer with time. PivotTables are designed to offer intuitive solutions for swiftly summarizing extensive datasets. Consequently, this feature is invaluable for gaining deeper insights, visualizing, and analysing large volumes of data.

To simplify understanding and highlight the versatility of PivotTables, this section encapsulates some of the most common and practical applications of this function.

- **Comparison of total sales of several products**

  Suppose we have a worksheet containing monthly sales figures for three distinct products, and our objective is to ascertain which of the three yielded the highest revenue.

  One method would involve analysing the worksheet and manually updating the sales figure corresponding each occurrence of product 1. This process would subsequently be repeated for product 2 and product 3 until comprehensive totals are obtained for each.

  When dealing with vast datasets, like thousands of rows in a monthly sales worksheet, manually sorting each data item becomes an arduous task. This is where PivotTables prove invaluable. With PivotTables, you can effortlessly aggregate all sales data for product 1, product 2, and product 3, swiftly calculating their respective sums in less than a minute.

- **Displaying sales on a percentage basis**

  When PivotTables are created, they automatically display totals for each row or column. However, this is just one aspect of the data that can be automatically generated.

  When sales figures for three products are entered into a worksheet and converted into a PivotTable, the function automatically
