provides totals at the bottom of each column by summing the sales of each product.
Furthermore, these values can be converted into percentages through a special configuration that allows each column's formatting to be adjusted. This results in percentages representing each product's sales contribution to the total sales of the three products, rather than displaying absolute numbers.
For instance, if the total sales amounted to €100,000, with €25,000 attributed to product 1, the PivotTable can be modified to display the result as 25% of the company's total sales.
To display product sales as a percentage of total sales in a PivotTable, right-click on the cell displaying total sales. Then, select the option Show values as *% of Grand Total*.

Row Labels	Sum of UNIT PRICE	Sum of USEFUL
Product 1	670 €	9.43%
Product 2	1,893 €	67.48%
Product 3	823 €	23.09%
Grand Total	**3,386 €**	**100.00%**

- **Merging of duplicate data**
  When dealing with extensive datasets, it is common for some of the data to be duplicated. To ensure accurate results, it's essential to merge totals or eliminate duplicates.
  Manually performing this task would be time-consuming, involving the manual search and merging of all duplicate data entries. However, with PivotTables, you can summarize the data by title or other values. Excel will then automatically merge all duplicate data and provide the aggregated results, saving considerable time and effort.

- **Getting nonintuitive values**
  PivotTables are also useful for automatically computing elements that aren't readily discernible in a standard Excel table. One such function involves tallying rows that share a common element.
  For instance, consider a worksheet containing a list of company
